Mrs.C.Manonmani

SRM TRP ENGINEERING COLLEGE

Academic Year: 2026-27 (ODD)

Department of Information Technology

CERTIFICATE

This is to certify that [Team Member Names] from **second year IT** has successfully completed her work titled **"Online Job Portal**" at SRM TRP Engineering, Trichy in the partial fulfillment of the Bachelor's of Technology in Information Technology.

Mrs.C.Manonmani
(Faculty In-charge)
Artificial Intelligence & Data Science

Dr.
(Head of Department)
Information Technology

ACKNOWLEDGEMENT

It is with sincere gratitude and deep appreciation that I take this opportunity to acknowledge the invaluable support and guidance I have received throughout the course of this project. This journey has been both intellectually enriching and personally rewarding, significantly enhancing my understanding of the subject and its practical applications. I would like to express my heartfelt thanks to all those who provided guidance, encouragement, and constructive feedback during the development of this project. Their insights and support were instrumental in shaping the direction and quality of the work. I also extend my appreciation to the department for fostering an environment that promotes learning, innovation, and academic growth. The resources and opportunities provided played a vital role in the successful completion of this project. A special note of thanks goes to the supporting staff for their cooperation and timely assistance, which ensured that the process remained smooth and efficient at every stage. Finally, I would like to express my deepest gratitude to my parents for their constant support, encouragement, and belief in my abilities. Their motivation has been a source of strength throughout this journey. This project has not only strengthened my knowledge but has also emphasized the importance of dedication, perseverance, and continuous learning. I remain sincerely thankful to everyone who contributed, directly or indirectly, to the successful completion of this project.

Academic Year: 2026-2027

ABSTRACT

The Online Job Portal, branded as **JobFinder**, is a web-based application that connects job seekers with employers through a simple, easy-to-use website. Finding a suitable job through newspapers, notice boards and word of mouth is slow, and candidates often miss openings that match their skills. This project provides a single online place where job opportunities are listed clearly and can be searched and applied for from any device with a browser.

The portal presents a home page with a search option, a list of the latest job opportunities, a job application form, an About Us section and a Contact Us section. Each job is shown as a card that gives the job title, company name, location, salary range and job type (full time or part time), together with an Apply Now button. If a search finds no matching jobs, the user is shown a helpful message to try another search.

The application is developed using HTML5 for the page structure, CSS3 for styling and layout, and JavaScript for client-side interactivity such as searching job cards. The project is hosted on GitHub Pages, which makes it available online at no cost and allows updates to be published directly from the GitHub repository.

The main objective of this project is to demonstrate the use of core web technologies to build a responsive, user-friendly job portal that reduces the time and effort needed to discover and apply for jobs.

Keywords: Online job portal, JobFinder, job search, web application, HTML, CSS, JavaScript, GitHub Pages.

INTRODUCTION

Introduction: Online Job Portal

Employment is one of the most important needs of a student or a working professional. Today most recruitment activity has moved online, and employers prefer to publish vacancies on web platforms where a large number of candidates can see them quickly. For candidates, an online job portal saves the effort of visiting several places to look for openings and makes it easy to compare jobs by company, location, salary and type of employment.

In the traditional method, job seekers depend on newspaper advertisements, campus notices and personal contacts. These sources are limited in reach, are often out of date, and give no easy way to search by skill or location. Employers, on the other hand, find it costly and slow to reach suitable candidates.

The Online Job Portal (JobFinder) addresses these problems by offering a clean web interface in which openings are displayed in one place. The portal is designed for the people of Tamil Nadu and the neighbouring region, with sample openings in cities such as Chennai, Coimbatore, Madurai, Trichy and Bangalore, and salaries shown in Indian rupees.

1.1 Objectives

- To provide a single web platform where job opportunities can be viewed easily.
- To display each job with its title, company, location, salary and job type.
- To allow job seekers to search for jobs and to show a clear message when nothing matches.
- To provide a job application form through which candidates can apply.
- To provide company information (About Us) and contact details for support.
- To build a responsive, attractive interface that works on desktops, tablets and mobile phones.
- To host the project online using GitHub Pages so that it can be accessed from anywhere.

1.2 Scope of the Project

The current version of the portal is a front-end web application. It covers the display of job listings, searching of jobs, a job application form, and the informational About and Contact sections. It can be used by students and job seekers to explore opportunities and by institutions as a base design for a placement portal.

The project can be extended in the future with user registration and login, an employer dashboard for posting jobs, a database to store jobs and applications, resume upload, filters for location and salary, and e-mail notifications.

1.3 Existing System

In the existing manual system, vacancies are announced through newspapers, notice boards, campus placement cells and personal references. A candidate has to collect this information from many sources and then apply separately to each employer. The main

drawbacks of this system are:

- Information is scattered and difficult to collect in one place.
- Vacancy details may be incomplete or outdated by the time they are read.
- There is no easy way to search or compare jobs by location, salary or type.
- Applying requires physical visits, postal mail or separate e-mails.
- Employers have limited reach and spend more time and money on advertising.

1.4 Proposed System

The proposed Online Job Portal collects job opportunities on one web page and presents them in a uniform card layout. A visitor can read the latest openings, search for a job, and apply through the job application form without installing any software. Because the site is hosted on GitHub Pages, it is available at all times through a single web link. The advantages of the proposed system are:

- All job information is available in one place.
- Jobs are shown in a uniform format, so they are easy to compare.
- Search saves the time spent scrolling through every listing.
- The portal works on any device with a modern browser.
- Hosting is free, and updating the site is quick.
- The design is simple and can easily be extended with new features.

1.5 Organization of the Report

- Chapter 1 – Introduction: background, objectives, scope, and existing and proposed systems.
- Chapter 2 – System Requirements: hardware, software, functional requirements, feasibility and technologies.
- Chapter 3 – System Design: architecture, use case, data flow, sequence, site map and interface design.
- Chapter 4 – Implementation: frontend development, search logic, deployment and output screens.
- Chapter 5 – Testing: test environment and test cases.
- Chapter 6 – Result and Conclusion: outcome, limitations and future enhancements.

SYSTEM REQUIREMENTS

System Requirements

System requirements specify the hardware and software needed to develop and to use the application. Since the portal is a static website, the requirements are modest.

2.1 Hardware Requirements

- Processor: Intel Core i3 or equivalent and above.
- RAM: Minimum 4 GB.
- Storage: Minimum 1 GB of free space for tools and project files.
- Monitor: Standard display (the site also adapts to mobile screens).
- Input devices: Keyboard and mouse (or touch screen).
- Network: Internet connection to access the hosted portal and to publish updates.

2.2 Software Requirements

- Operating System: Windows, Linux or macOS.
- Frontend: HTML5, CSS3 and JavaScript.
- Code Editor: Visual Studio Code or an equivalent editor.
- Version Control: Git and a GitHub account.
- Hosting: GitHub Pages (static web hosting).
- Browser: Google Chrome, Mozilla Firefox, Microsoft Edge or another modern browser.

2.3 Functional Requirements

- Display a home page with a title, tagline and a Search Jobs option.
- Navigate between Home, Jobs, About and Contact sections using the menu bar.
- List the latest job opportunities as cards with company, location, salary and type.
- Provide an Apply Now button for each job.
- Search the listed jobs and show a message when no job is found.
- Provide a Job Application Form with a Submit Application button.
- Show About Us information and Contact Us details.

2.4 Non-Functional Requirements

- Usability: simple navigation and clearly readable job information.
- Responsiveness: the layout adapts to different screen sizes using the viewport meta tag and CSS.
- Performance: fast loading since the site consists of lightweight static files.
- Availability: hosted on GitHub Pages and accessible at any time through a web link.
- Portability: works on all modern browsers without installing any software.
- Maintainability: the code is organised in clear sections so that new jobs and features can be added easily.

2.5 Feasibility Study

Technical feasibility: The project uses HTML, CSS and JavaScript, which are

standard web technologies supported by every modern browser. No special hardware or server software is needed, so the project is technically feasible.

Economic feasibility: All tools used (a code editor, Git, a browser and GitHub Pages) are free. The project therefore needs no investment in software licences or hosting.

Operational feasibility: The interface is simple and familiar, so a user needs no training to browse jobs, search and apply. Updating the portal only requires editing the project files and publishing them to GitHub.

2.6 Technologies Used

Table 2.1 summarises the technologies used in the project and the role of each.

Table 2.1: Technologies used

Technology	Purpose in the project
HTML5	Defines the structure of the page: menu, hero section, job cards, form, About and Contact sections and footer.
CSS3	Controls colours, fonts, spacing and the card layout, and makes the page responsive.
JavaScript	Adds client-side behaviour such as searching the job cards and handling the buttons and form.
Git and GitHub	Version control and storage of the project files in the onlinejobportal repository.
GitHub Pages	Hosts the static website over HTTPS and publishes the live portal.
Visual Studio Code	Editor used to write and test the code.

HTML5 is the standard markup language of the web. It provides elements such as headings, sections, forms and buttons, which describe the content of the page to the browser. **CSS3** separates presentation from content and supports features such as flexible layouts and media queries for different screen sizes. **JavaScript** is the scripting language that runs in the browser and allows the page to respond to user actions without reloading. **GitHub Pages** is a service that publishes the files of a GitHub repository as a website, which is well suited to static projects such as this portal.

SYSTEM DESIGN

System Design: Online Job Portal (Architecture Diagram)

The Online Job Portal follows a simple client-side architecture. All pages and logic are delivered to the user's browser as static files from GitHub Pages. The browser renders the HTML and CSS, and JavaScript running in the browser handles the interactive behaviour such as searching the job cards. There is no separate application server or database in this version of the project.

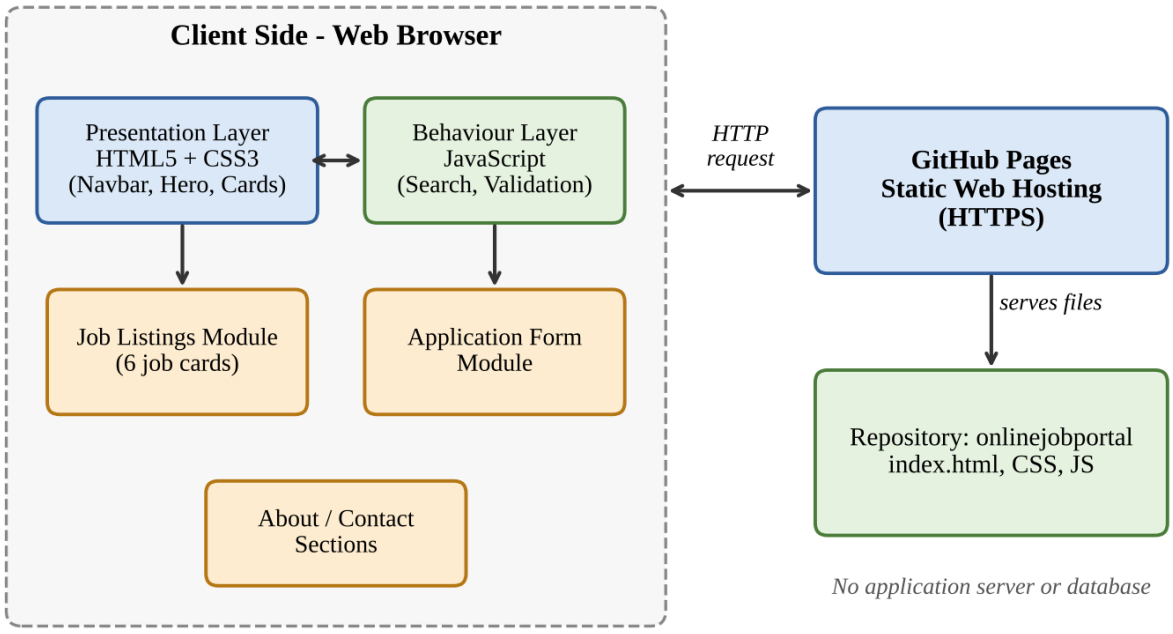

Figure 3.1: Architecture of the Online Job Portal

3.1 Page Structure and Modules

The portal is a single-page website divided into sections that are reached from the navigation bar. Table 3.1 lists the sections and their purpose.

Table 3.1: Sections of the portal

Section	Description
Navigation Bar	Brand name "JobFinder" with links to Home, Jobs, About and Contact.
Hero / Home	Heading "Find Your Dream Job Today!", a short tagline and the Search Jobs option.
Latest Job Opportunities	Six job cards showing title, company, location, salary, type and an Apply Now button.
Job Application Form	Form with a Submit Application button for applying to jobs.
About Us	Short description of JobFinder and its purpose.
Contact Us	Support e-mail, phone number and location.
Footer	Copyright notice: © 2026 JobFinder. All Rights Reserved.

3.2 Job Listing Data Design

Each job card is built from the same set of attributes, which keeps the design consistent and makes it easy to add new jobs. The attributes are shown in Table 3.2.

Table 3.2: Attributes of a job listing

Attribute	Description	Example
Job Title	Name of the position	Web Developer
Company	Employer offering the job	ABC Technologies
Location	City where the job is based	Chennai
Salary	Monthly salary range in rupees	₹25,000 - ₹40,000
Type	Full Time or Part Time	Full Time

3.3 Use Case Diagram

The use case diagram in Figure 3.2 shows how the actors interact with the portal. The Job Seeker uses the public features of the site, while the Site Maintainer updates the job listings by editing the project files and publishing them to GitHub.

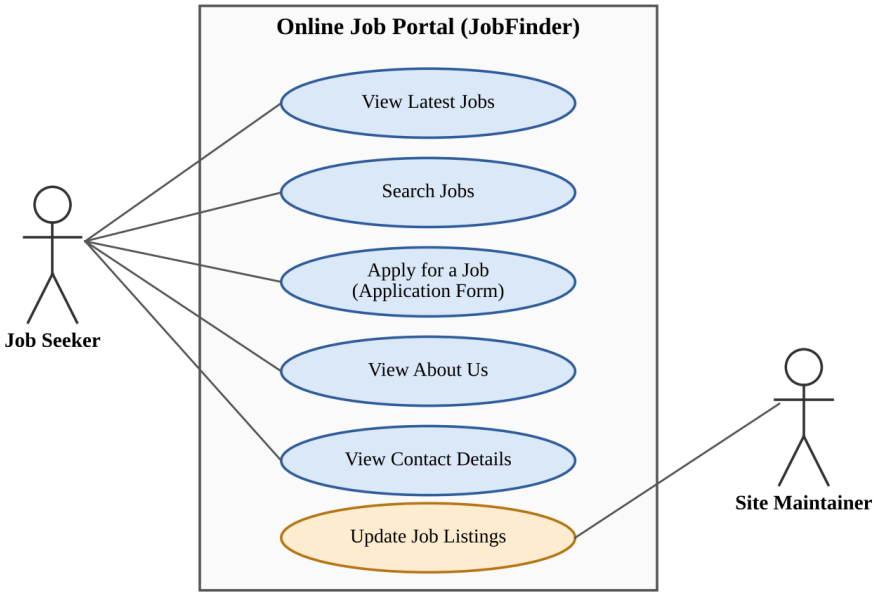

Figure 3.2: Use case diagram

Table 3.3: Use cases

Use Case	Actor	Description
View Latest Jobs	Job Seeker	Browse the job cards shown on the page.
Search Jobs	Job Seeker	Enter a keyword to find matching jobs.
Apply for a Job	Job Seeker	Use Apply Now and the application form to apply.
View About Us	Job Seeker	Read about JobFinder and its purpose.
View Contact Details	Job Seeker	Read the e-mail, phone and location of the support team.
Update Job Listings	Site Maintainer	Add or change jobs in the project files and publish them.

3.4 Data Flow Diagrams

The context-level data flow diagram (Level 0) in Figure 3.3 shows the portal as a single process that exchanges data with the Job Seeker and the Site Maintainer. The Job Seeker sends search keywords and application details and receives job lists and messages. The Site Maintainer supplies the updated job data.

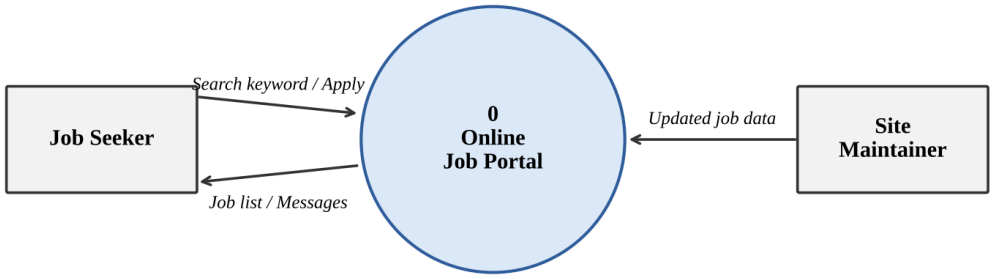

Figure 3.3: Data flow diagram – Level 0

Figure 3.4 expands the portal into three main processes: displaying jobs, searching jobs and submitting an application. The first two read the job listings (D1), while the third handles the details entered in the application form (D2).

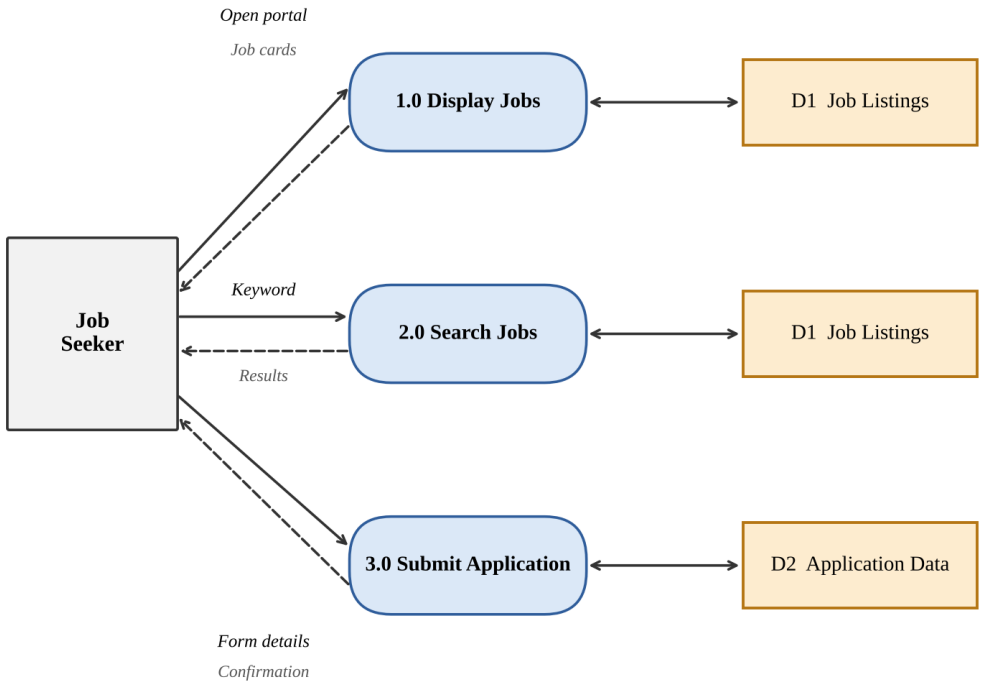

Figure 3.4: Data flow diagram – Level 1

3.5 Overall System Workflow

A visitor opens the portal link and the browser downloads the page from GitHub Pages. The visitor can browse the latest jobs or search for a job. Matching job cards are displayed, or a message is shown if nothing matches. When the visitor selects Apply Now, he or she fills in the Job Application Form and submits it.

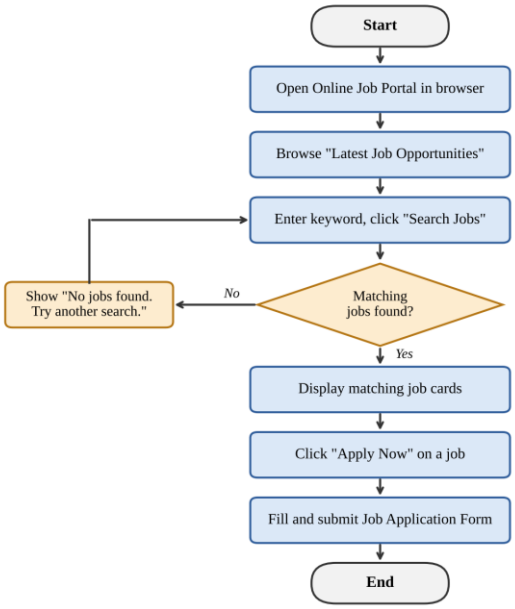

Figure 3.5: Job search and application flow

3.6 Sequence Diagram

The sequence diagram in Figure 3.6 shows the order of messages between the Job Seeker, the web browser and GitHub Pages. GitHub Pages is contacted only once, to download the page files. After that, searching and form handling take place inside the browser.

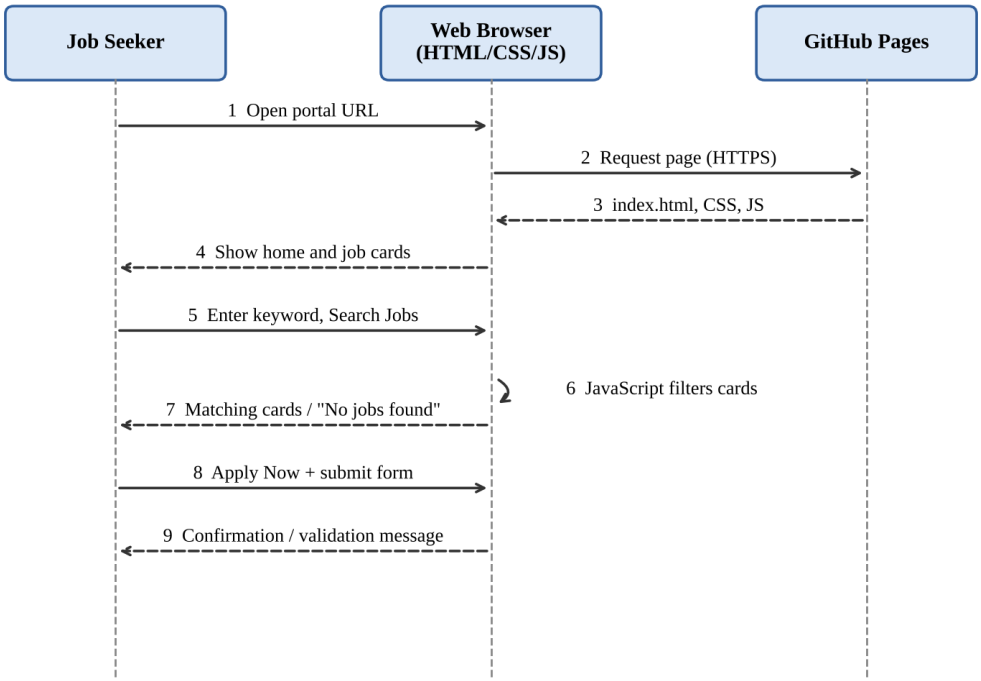

Figure 3.6: Sequence diagram

3.7 Site Map and Navigation

The site map in Figure 3.7 shows how the page is organised. The menu bar links to the Home, Jobs, About and Contact sections using in-page anchors, so the user can reach any section with a single click without leaving the page.

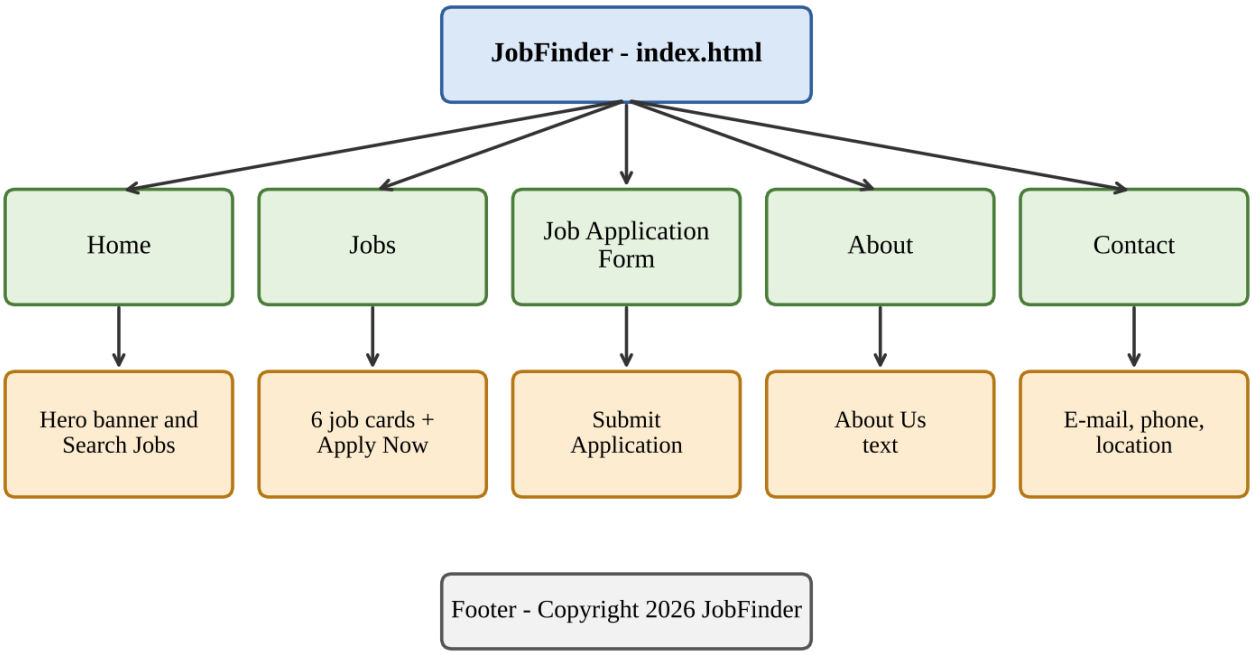

Figure 3.7: Site map of the portal

3.8 User Interface Design

Figure 3.8 shows the wireframe (layout plan) of the home page. The menu bar is at the top, followed by the hero banner with the Search Jobs option, the grid of job cards, the application form with the About and Contact information, and the footer.

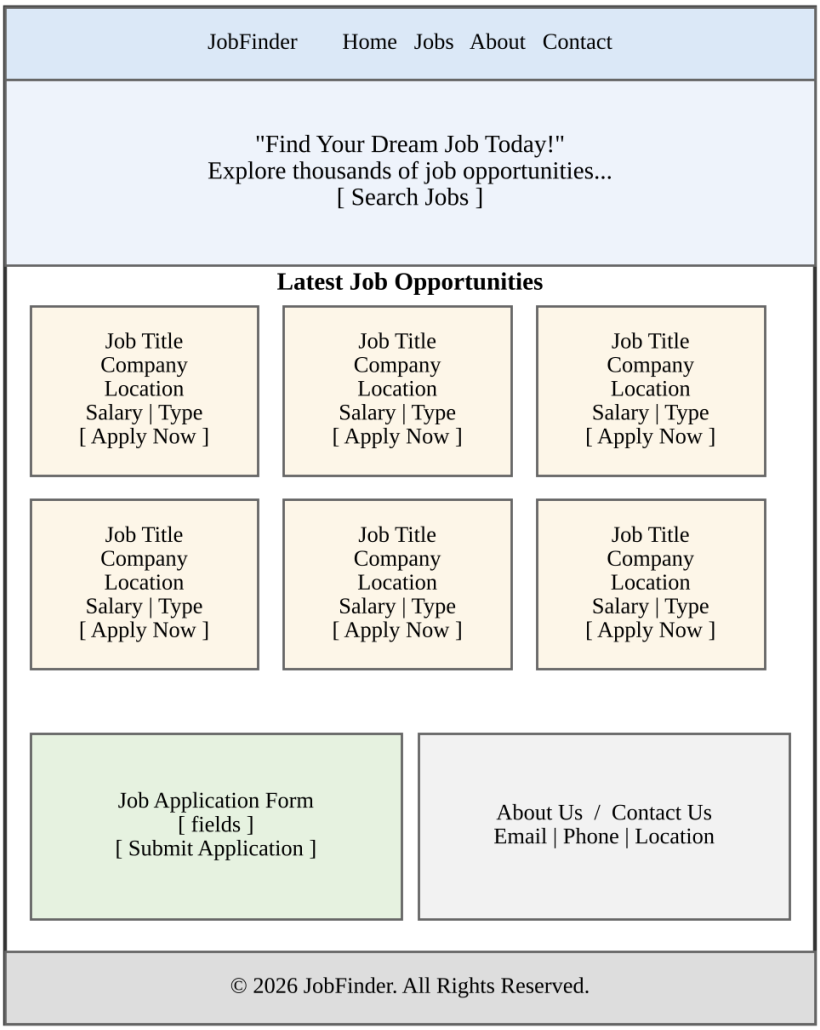

Figure 3.8: Wireframe of the home page

- A menu bar gives quick access to every section of the page.
- A prominent hero section with a clear call to action invites the user to search jobs.
- Job information is presented as equal-sized cards so that jobs can be compared easily.
- Important details such as salary and job type are labelled so they are easy to scan.
- The viewport meta tag and CSS allow the layout to adjust for mobile screens.

3.9 Hosting and Deployment Design

The project files are stored in the GitHub repository named onlinejobportal. GitHub Pages publishes the repository as a website over HTTPS. Any change committed to the repository is published to the live site, which makes updating the portal quick and free of cost. The live project is available at https://bvrasikha-gif.github.io/onlinejobportal/.

IMPLEMENTATION

Implementation involves converting the system design into a working web application. The portal is implemented as a front-end website using HTML, CSS and JavaScript and is deployed on GitHub Pages.

Output as expected is as follows

4.1 Frontend Development

HTML5 is used to create the structure of the page: the navigation bar, the hero section, the job cards, the application form, the About Us and Contact Us sections and the footer. The viewport meta tag is included so that the page scales correctly on mobile devices, and in-page anchor links connect the menu items to their sections.

CSS3 is used to style the pages and create a consistent layout, including the menu bar, the hero banner, the card layout of the jobs, buttons and the form. A common style is applied to all job cards so that every listing looks the same.

4.2 Client-Side Behaviour

JavaScript is used to make the page interactive. When a user enters a keyword and uses Search Jobs, the job cards are checked and only the matching cards remain visible. If no card matches, the message "No jobs found. Try another search." is displayed. The Apply Now buttons and the Submit Application button of the Job Application Form are also handled on the client side.

4.3 Job Listings

The portal lists six sample job opportunities. They cover different roles, cities and types of employment, as shown in Table 4.1.

Table 4.1: Job opportunities listed in the portal

Job Title	Company	Location	Salary	Type
Web Developer	ABC Technologies	Chennai	₹25,000 - ₹40,000	Full Time
Software Engineer	Tech Solutions	Bangalore	₹30,000 - ₹50,000	Full Time
UI/UX Designer	Creative Studio	Coimbatore	₹20,000 - ₹35,000	Part Time
Data Analyst	Data World	Chennai	₹25,000 - ₹45,000	Full Time
Digital Marketing Executive	Media Works	Madurai	₹18,000 - ₹30,000	Full Time
Python Developer	Smart Systems	Trichy	₹28,000 - ₹45,000	Full Time

4.4 Search Logic

The search feature compares the keyword typed by the user with the text of each job card. The logic can be expressed in the following pseudo-code. It is given to explain the working of the feature and is not a copy of the project source code.

```
READ keyword FROM search box
keyword = TRIM(keyword) and convert to lower case
matches = 0
FOR each job card IN job list
    text = title + company + location + type of the card
    IF text (lower case) CONTAINS keyword THEN
        SHOW the card ; matches = matches + 1
    ELSE
        HIDE the card
IF matches = 0 THEN
    SHOW message "No jobs found. Try another search."
ELSE
    HIDE the message
```

Figure 4.1: Pseudo-code of the job search logic

4.5 Job Application Process

The Job Application Form allows a candidate to apply for a job. The process followed by the portal is:

- The user selects Apply Now on a job card or moves to the Job Application Form section.
- The user enters the requested details in the form.
- The user selects Submit Application.
- The form data is checked in the browser, and the user is informed whether the application was accepted or needs correction.

4.6 Responsive Design

The page includes the viewport meta tag and uses CSS layout techniques so that the content adapts to the width of the screen. On a wide desktop screen the job cards can be shown side by side, while on a narrow mobile screen the cards stack one below the other. This ensures that the portal is comfortable to use on computers, tablets and phones.

4.7 Deployment on GitHub Pages

- Create a repository named onlinejobportal on GitHub.
- Upload the project files (index.html and any style and script files) to the repository.
- Open the repository Settings and select the Pages option.
- Choose the branch and folder that contain the site and save.
- Wait a short time for GitHub to build the site, then open the published link: https://bvrasikha-gif.github.io/onlinejobportal/.

4.8 Security and Validation Considerations

- The site is served over HTTPS by GitHub Pages, and form inputs should be validated in the browser before submission.
- This version has no server or database, so no personal data is stored by the portal; a future backend must validate inputs on the server and use secure password hashing and prepared statements.
- User-entered text should be escaped before it is displayed in the page to avoid script injection.

OUTPUT SCREEN SHOT

The live portal can be opened at https://bvrasikha-gif.github.io/onlinejobportal/. The following screens of the portal are to be inserted below.

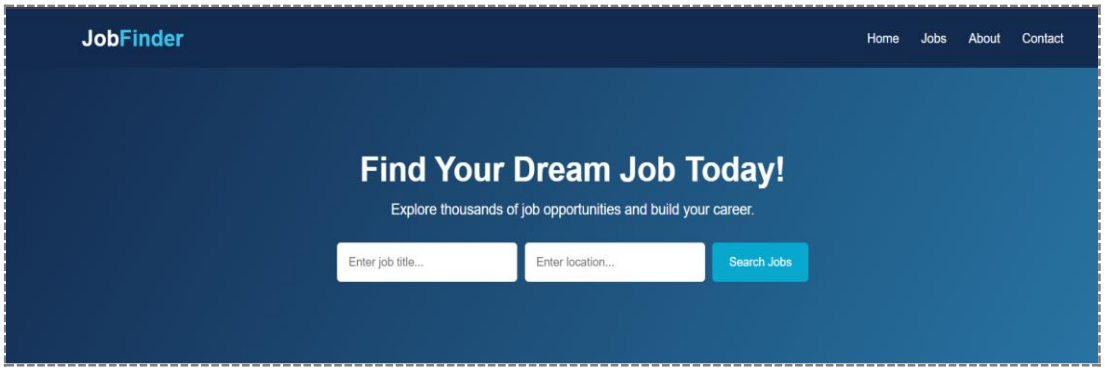

Figure 4.2: Home page

CODING – (SCREENSHOT)

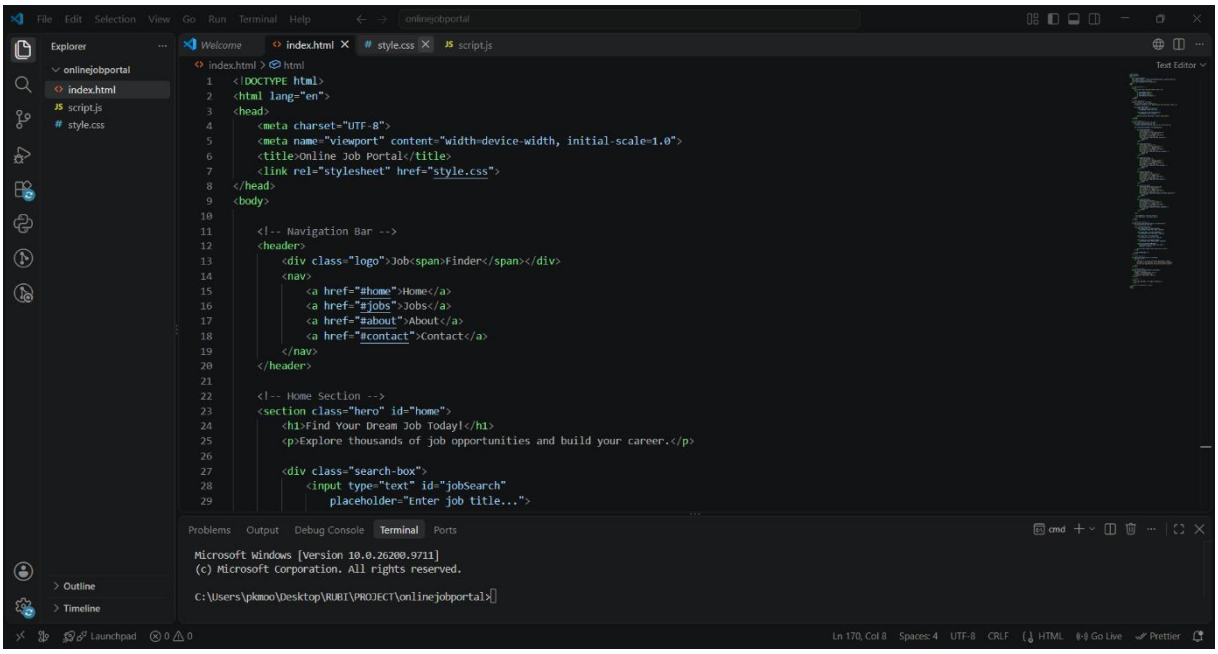

Figure 4.9 – index.html

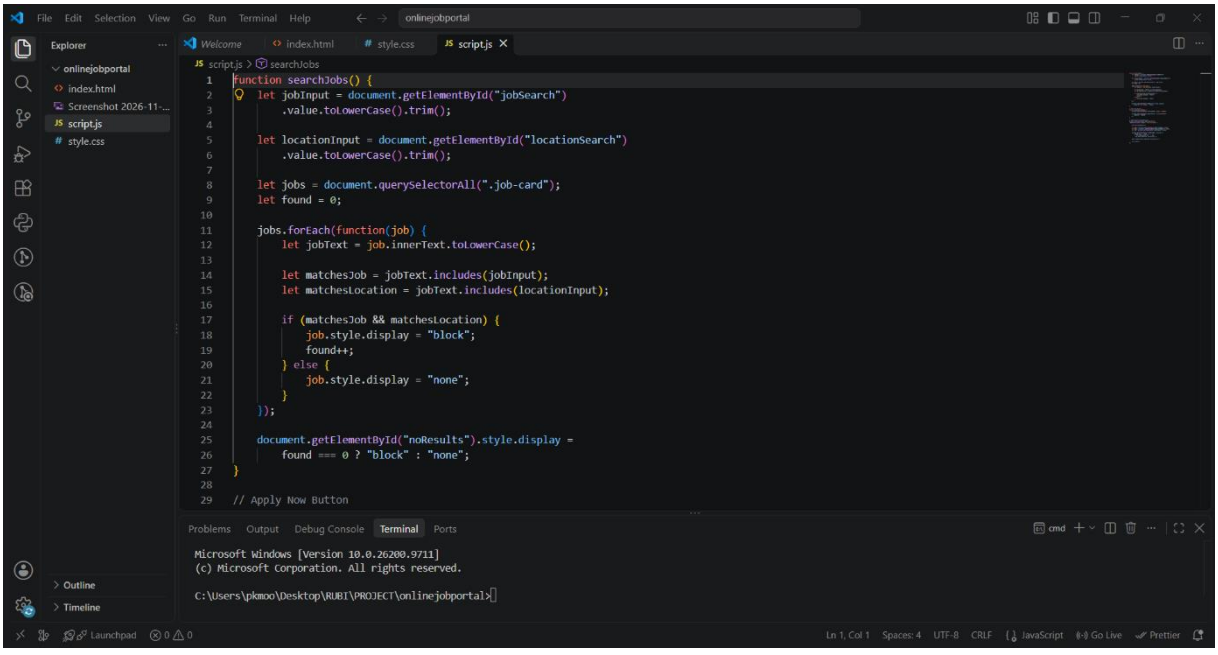

Figure 4.10 – script.js (javascript – Backend)

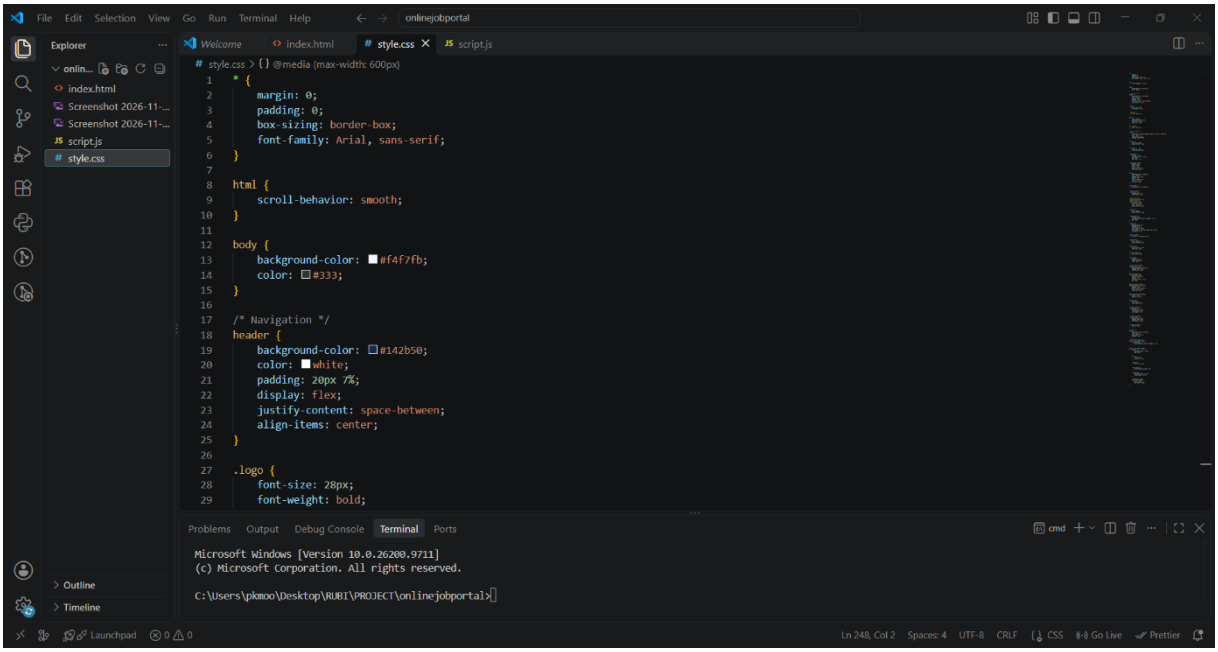

Figure 4.11 style.css

TESTING

Testing is performed to verify that the portal works correctly and meets the specified requirements.

5.1 Types of Testing

Functional Testing: Each feature, such as navigation, searching and the application form, is tested to confirm that it behaves as expected.

Usability Testing: The portal is checked for ease of navigation and clarity of the job information.

Responsive Testing: The layout is checked on different screen sizes such as desktop, tablet and mobile.

Compatibility Testing: The portal is opened in Chrome, Firefox and Edge to confirm that it displays and works the same way.

Input Validation Testing: The application form is tested with empty and valid inputs.

5.2 Test Environment

Table 5.1: Test environment

Item	Details
Operating System	Windows / Linux / macOS
Browsers	Google Chrome, Mozilla Firefox, Microsoft Edge
Devices	Desktop or laptop, tablet and mobile phone
Network	Internet connection
Application under test	https://bvrasikha-gif.github.io/onlinejobportal/

5.3 Test Cases

The test cases are grouped as functional, interface and compatibility, and form validation tests.

Table 5.2: Functional test cases

No.	Test Case	Input / Action	Expected Result
1	Page load	Open the portal URL	Home page loads with the JobFinder menu and the "Find Your Dream Job Today!" banner.
2	Navigate to Home	Click Home in the menu	The page moves to the home section.
3	Navigate to Jobs	Click Jobs in the menu	The page moves to Latest Job Opportunities.
4	Navigate to About	Click About in the menu	The page moves to the About Us section.
5	Navigate to Contact	Click Contact in the menu	The page moves to the Contact Us section.
6	Job listing display	Scroll to Latest Job Opportunities	Six job cards are shown with company, location, salary and type.
7	Search with a valid keyword	Search for "Python"	The Python Developer card is displayed.

No.	Test Case	Input / Action	Expected Result
8	Search by city	Search for "Chennai"	The jobs located in Chennai are displayed.
9	Search with no match	Search for a word that is not in any job	The message "No jobs found. Try another search." is displayed.
10	Apply Now button	Click Apply Now on a job	The user is taken to the job application process.

Table 5.3: Interface and compatibility test cases

No.	Test Case	Input / Action	Expected Result
11	Job card details	Check each job card	Title, company, location, salary and job type are all visible.
12	Responsive layout	Open the portal on a mobile screen	The content fits the screen without horizontal scrolling.
13	Tablet layout	Open the portal on a tablet screen	The cards and form are arranged neatly.
14	Chrome browser	Open the portal in Chrome	The page displays and works correctly.
15	Firefox browser	Open the portal in Firefox	The page displays and works correctly.
16	Edge browser	Open the portal in Edge	The page displays and works correctly.

Table 5.4: Form validation test cases

No.	Test Case	Input / Action	Expected Result
17	Empty application form	Click Submit Application without filling the form	The form is not accepted and the user is asked to complete the details.
18	Valid application form	Fill in valid details and submit	The application is accepted and a confirmation is shown.
19	Invalid e-mail format	Enter an incorrectly formatted e-mail address	The user is asked to enter a valid e-mail address.
20	Repeated submission	Submit the form twice quickly	The portal handles the second submission without an error.

The test cases above describe the expected behaviour of the portal. The final test results should be recorded after executing the test cases on the live portal.

RESULT AND CONCLUSION

6.1 Result

- The Online Job Portal (JobFinder) successfully provides a simple platform where job seekers can view the latest job opportunities, search for jobs and apply through an online form.
- Each job is displayed in a clear card format with the title, company, location, salary and type, which helps candidates compare jobs quickly. The portal also provides About Us and Contact Us information.
- The project demonstrates the practical use of HTML, CSS and JavaScript to build a responsive web application, and shows how GitHub Pages can be used to host and publish a project online at no cost.

6.2 Limitations

- The current version is a front-end application, so job data is kept in the page and there is no database.
- There is no user registration or login, and employers cannot post jobs through the portal.
- Search is limited to keyword matching and does not yet offer filters for location or salary.

6.3 Future Enhancements

- User registration and login for job seekers and employers.
- An employer dashboard to post, edit and remove jobs.
- A database and backend (for example Node.js or PHP with MySQL) to store jobs and applications.
- Resume upload and application tracking.
- Filters for location, salary and job type, and sorting of results.
- E-mail or mobile notifications for new jobs.

6.4 Conclusion

- In conclusion, the Online Job Portal offers an effective and user-friendly approach to online job searching. It reduces the effort of finding and comparing vacancies and can be enhanced in future with the features listed above.
